# Example 4.1 (a)

#### Problem

- Consider the functions  $g(x) = x^2 + 4$  and h(z) = 5z 1.
- Find the composite function  $(g \circ h)(z)$ .
- Write out the function and simplify.

3

イロト イヨト イヨト イヨト

# Solution

## Solution

The composite function  $(g \circ h)(z)$  is formed by substituting h(z) into g(x):

$$(g \circ h)(z) = g(h(z)) = g(5z - 1)$$
  
Substituting  $h(z) = 5z - 1$  into  $g(x) = x^2 + 4$ , we get:

$$g(5z-1) = (5z-1)^2 + 4$$

Now, let's expand  $(5z-1)^2$ :

$$(5z-1)^2 = (5z)^2 - 2 \cdot 5z \cdot 1 + 1^2 = 25z^2 - 10z + 1$$

So the composite function is:

$$(g \circ h)(z) = 25z^2 - 10z + 1 + 4 = 25z^2 - 10z + 5$$

# Example 4.3 (a)

#### Problem

- Consider the functions  $g(x) = x^2 + 4$  and h(z) = 5z 1.
- Find the derivative of the composite function  $(g \circ h)(z)$ .
- Use the Chain Rule to compute the derivative from the two component functions.

4/39

イロト イヨト イヨト

## Solution

## Solution

find  $\frac{d}{dz}[g(h(z))]$ . Using the Chain Rule:

$$\frac{d}{dz}\left[g(h(z))\right] = g'(h(z)) \cdot h'(z)$$

1) Compute the derivative of the outside function  $g(x) = x^2 + 4$ :

$$g'(x) = 2x$$

2) Compute the derivative of the inside function h(z) = 5z - 1:

$$h'(z) = 5$$

- E-	$\sim$	$\sim$	N I	0	0	-
	U	U	IN	2	U:	э

## Solution

3) Apply the Chain Rule:

$$\frac{d}{dz}\left[g(h(z))\right] = g'(h(z)) \cdot h'(z)$$

Substituting h(z) = 5z - 1 into g'(x), we get:

$$g'(h(z)) = 2(5z - 1)$$

Now, multiply by h'(z) = 5:

$$\frac{d}{dz}\left[g(h(z))\right] = 2(5z-1)\cdot 5$$

4) Simplify the result:

$$\frac{d}{dz}\left[g(h(z))\right] = 10(5z - 1) = 50z - 10$$

# Example 4.3 (a)

#### Problem

Consider the functions:  $g(x) = x^2 + 4$  and h(z) = 5z - 1

Compute the derivative of the composite function  $(g \circ h)(z)$ 

- each derivative directly
- using the Chain Rule

Simplify your Solution and compare both methods.

3

・ロン ・回 と ・ ヨ と ・

#### Chain Rule

## Solution (part 1)

#### Direct computation of the derivative

The composite function is:

$$(g \circ h)(z) = g(h(z)) = g(5z - 1)$$

Substitute h(z) = 5z - 1 into  $g(x) = x^2 + 4$ :

$$g(5z-1) = (5z-1)^2 + 4$$

Now differentiate directly with respect to z:

### Differentiation

$$\frac{d}{dz}\left[(5z-1)^2+4\right] = \frac{d}{dz}\left[(5z-1)^2\right] + \frac{d}{dz}[4]$$

The derivative of the constant 4 is 0, so we focus on:

$$\frac{d}{dz}\left((5z-1)^2\right) = 2(5z-1) \cdot \frac{d}{dz}(5z-1) = 2(5z-1) \cdot 5 = 10(5z-1)$$

Thus, the derivative is:

$$\frac{d}{d} \left[ (5z-1)^2 + 4 \right] = 10(5z-1)$$
Problems and Solutions-IV

ECON 205

8/39

18 October 2024

#### Chain Rule

# Solution (part 2)

## Derivative Using the Chain Rule

The Chain Rule states that:

$$\frac{d}{dz}[g(h(z))] = g'(h(z)) \cdot h'(z)$$

Let's compute each part:

• The derivative of 
$$g(x) = x^2 + 4$$
 is:

$$g'(x) = 2x$$

• The derivative of 
$$h(z) = 5z - 1$$
 is:

$$h'(z) = 5$$

### **Chain Rule Application**

Now, apply the Chain Rule:

$$\frac{d}{dz}[g(h(z))] = g'(h(z)) \cdot h'(z) = 2(5z-1) \cdot 5 = 10(5z-1)$$

ECON 205

# Comparison of the Results

Both methods give the same result:

- Direct differentiation: 10(5z-1)
- Chain Rule application: 10(5z 1)

Thus, the derivative of the composite function  $(g \circ h)(z)$  is:

$$10(5z-1)$$

# Example 4.1 (b)

#### Problem

- Consider the functions  $g(x) = x^3$  and h(z) = (z 1)(z + 1).
- Find the composite function  $(g \circ h)(z)$ .
- Write out the function and simplify.

3

イロト イヨト イヨト イヨト

# Solution

#### Solution

The composite function  $(g \circ h)(z)$  is formed by substituting h(z) into g(x):

$$(g \circ h)(z) = g(h(z)) = g((z-1)(z+1))$$

Substituting h(z) = (z - 1)(z + 1) into  $g(x) = x^3$ , we get:

$$(g \circ h)(z) = ((z - 1)(z + 1))^3$$

Now, simplify (z-1)(z+1):

$$(z-1)(z+1) = z^2 - 1$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶

# Solution

So the composite function becomes:

$$(g \circ h)(z) = (z^2 - 1)^3$$

$$(g \circ h)(z) = (z - 1)^3 \cdot (z + 1)^3$$

$$(z-1)^3 \cdot (z+1)^3 = z^6 - 3z^4 + 3z^2 - 1$$

So the composite function is:

$$(g \circ h)(z) = z^6 - 3z^4 + 3z^2 - 1$$

# Example 4.3 (b)

#### Problem

- Consider the functions  $g(x) = x^3$  and h(z) = (z 1)(z + 1).
- Find the derivative of the composite function  $(g \circ h)(z)$ .
- Use the Chain Rule to compute the derivative from the two component functions.

イロト イヨト イヨト

## Solution

### Solution

Using the Chain Rule:

$$\frac{d}{dz}\left[g(h(z))\right] = g'(h(z)) \cdot h'(z)$$

1) Compute the derivative of the outside function  $g(x) = x^3$ 

$$g'(x) = 3x^2$$

2) Compute the derivative of the inside function h(z) = (z - 1)(z + 1): First, simplify h(z):

$$h(z) = (z - 1)(z + 1) = z^{2} - 1$$

Now differentiate it:

$$h'(z) = 2z$$

ECON 205

Problems and Solutions-IV

#### Chain Rule

# Solution (cont.)

# 3) Apply the Chain Rule

$$\frac{d}{dz}\left[g(h(z))\right] = g'(h(z)) \cdot h'(z)$$

Substituting  $h(z) = z^2 - 1$  into g'(x), we get:

$$g'(h(z)) = 3(z^2 - 1)^2$$

Now, multiply by h'(z) = 2z:

$$\frac{d}{dz}\left[g(h(z))\right] = 3(z^2 - 1)^2 \cdot 2z$$

#### 4) Simplify the result

$$\frac{d}{dz}[g(h(z))] = 6z(z^2 - 1)^2$$

$$(g \circ h)'(z) = 6z(z-1)^2 \cdot (z+1)^2$$

17/39

イロト イポト イヨト イヨト

#### Chain Rule

### Solution (part 1)

#### Direct computation of the derivative

The composite function is:

$$(g \circ h)(z) = g(h(z)) = g((z-1)(z+1))$$

Substitute h(z) = (z - 1)(z + 1) into  $g(x) = x^{3}$ :

$$g((z-1)(z+1)) = [(z-1)(z+1)]^3$$

Now differentiate directly with respect to z:

#### Differentiation

First, simplify (z-1)(z+1):

$$(z-1)(z+1) = z^2 - 1$$

Now the composite function becomes:

$$g(h(z)) = (z^2 - 1)^3$$

ECON 205

Problems and Solutions-IV

# Solution (part 1)

## Differentiation

Differentiating with respect to z:

$$\frac{d}{dz}\left[(z^2-1)^3\right] = 3(z^2-1)^2 \cdot \frac{d}{dz}(z^2-1)$$

The derivative of  $z^2 - 1$  is 2z, so we get:

$$\frac{d}{dz}\left[(z^2-1)^3\right] = 3(z^2-1)^2 \cdot 2z = 6z(z^2-1)^2$$

Thus, the derivative is:

$$\frac{d}{dz}\left[(z^2 - 1)^3\right] = 6z(z^2 - 1)^2$$

・ロン ・四 と ・ 回 と ・ 回 と

æ

#### Chain Rule

# Solution (part 2)

### Derivative Using the Chain Rule

The Chain Rule states that:

$$\frac{d}{dz}[g(h(z))] = g'(h(z)) \cdot h'(z)$$

Let's compute each part:

• The derivative of 
$$g(x) = x^3$$
 is:

$$g'(x) = 3x^2$$

• The derivative of 
$$h(z) = (z - 1)(z + 1) = z^2 - 1$$
 is:  $h'(z) = 2z$ 

### **Chain Rule Application**

Now, apply the Chain Rule:

$$\frac{d}{dz}[g(h(z))] = g'(h(z)) \cdot h'(z) = 3(h(z))^2 \cdot 2z = 3(z^2 - 1)^2 \cdot 2z$$

Simplifying:

$$\frac{d}{dz}[g(h(z))] = 6z(z^2 - 1)^2$$

# Comparison of the Results

Both methods give the same result:

- Direct differentiation:  $6z(z^2-1)^2$
- Chain Rule application:  $6z(z^2-1)^2$

Thus, the derivative of the composite function  $(g \circ h)(z)$  is:

$$6z(z^2-1)^2$$

3

・ロ・・ (日・・ 日・・ 日・・

# **Example C1: Chain Rule**

### Problem

- Consider the profit function  $\pi(y) = 3y^3 5y + 2$  and the production function  $y = 4L^{\frac{1}{2}}$ .
- The composite profit function is:

$$P(L) = \pi(f(L)) = \pi(4L^{\frac{1}{2}})$$

• Please find the derivative  $\frac{d}{dL}P(L)$  using the Chain Rule.

◆□▶ ◆□▶ ◆臣▶ ★臣▶ 臣 のへの

## Solution

### 1) Inside and Outside Functions

- The function  $P(L) = \pi(f(L))$  is a composition of two functions:
  - The outside function is  $\pi(y) = 3y^3 5y + 2$ , where y = f(L).
  - The inside function is  $f(L) = 4L^{\frac{1}{2}}$ .

• To differentiate, we will apply the Chain Rule:

$$\frac{d}{dL}P(L) = \frac{d}{dy}\pi(y) \cdot \frac{d}{dL}f(L)$$

3

・ロン ・四 と ・ 回 と ・ 日 と

23/39

## 2) Differentiate the Outside Function

• Differentiate  $\pi(y) = 3y^3 - 5y + 2$  with respect to y:

$$\frac{d}{dy}\pi(y) = 9y^2 - 5$$

• So, 
$$\frac{d}{dy}\pi(f(L)) = 9(f(L))^2 - 5 = 9\left(4L^{\frac{1}{2}}\right)^2 - 5 = 9 \cdot 16L + (-5) = 144L - 5.$$

	$\sim$	$\sim$	NI	0	n	5
-	J	$\sim$	1.4	~		-

æ

・ロン ・四 と ・ 回 と ・ 回 と

### 3) Differentiate the Inside Function

- The inside function is  $f(L) = 4L^{\frac{1}{2}}$ .
- Differentiate it with respect to L:

$$\frac{d}{dL}f(L) = \frac{d}{dL}\left(4L^{\frac{1}{2}}\right) = 4 \times \frac{1}{2}L^{-\frac{1}{2}} = \frac{2}{L^{\frac{1}{2}}}$$

ECON 205

# 4) Combine the Results

Now we combine the derivatives:

$$\frac{d}{dL}P(L) = (144L - 5) \cdot \frac{2}{L^{\frac{1}{2}}}$$

Simplify the expression:

$$\frac{d}{dL}P(L) = \frac{2(144L - 5)}{L^{\frac{1}{2}}}$$

• Final simplified derivative:

$$\frac{d}{dL}P(L) = \frac{288L - 10}{L^{\frac{1}{2}}}$$

## **Example C2: Chain Rule**

### Problem

- Consider the demand function q(p) = 100 2p and the cost function  $C(q) = 3q^2 + 10q + 5$ .
- The composite cost function is:

$$C(p) = C(q(p)) = 3(q(p))^{2} + 10q(p) + 5$$

• Please find the derivative 
$$\frac{d}{dp}C(p)$$
 using the Chain Rule.

э

・ロン ・回 と ・ ヨ と ・

# Solution

### 1) Inside and Outside Functions

- The function C(p) = C(q(p)) is a composition of two functions:
  - The outside function is  $C(q) = 3q^2 + 10q + 5$ , where q = q(p).
  - The inside function is q(p) = 100 2p.
- To differentiate, we will apply the Chain Rule:

$$\frac{d}{dp}C(p) = \frac{d}{dq}C(q) \cdot \frac{d}{dp}q(p)$$

29/39

## 2) Differentiate the Outside Function

• Differentiate  $C(q) = 3q^2 + 10q + 5$  with respect to q:

$$\frac{d}{dq}C(q) = 6q + 10$$

• So, 
$$\frac{d}{dq}C(q(p)) = 6q(p) + 10.$$

• Substituting q(p) = 100 - 2p into the result:

$$\frac{d}{dq}C(q(p)) = 6(100 - 2p) + 10 = 600 - 12p + 10 = 610 - 12p$$

# 3) Differentiate the Inside Function

- The inside function is q(p) = 100 2p.
- Differentiate it with respect to *p*:

$$\frac{d}{dp}q(p) = \frac{d}{dp}\left(100 - 2p\right) = -2$$

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

# 4) Combine the Results

• Now we combine the derivatives:

$$\frac{d}{dp}C(p) = (610 - 12p) \cdot (-2)$$

• Simplifying the expression:

$$\frac{d}{dp}C(p) = -2(610 - 12p) = -1220 + 24p$$

・ロ・・ (日・・ 日・・ 日・・

# **Example C3: Chain Rule**

### Problem

- Consider the revenue function  $R(p) = p \cdot q(p)$ , where q(p) = 100 2p is the demand function, and the cost function  $C(q) = 4q^2 + 20q + 50$ .
- The composite cost function is:

$$C(R(p)) = 4(R(p))^{2} + 20R(p) + 50$$

• Please find the derivative 
$$\frac{d}{dp}C(R(p))$$
 using the Chain Rule.

34/39

・ロン ・回 と ・ ヨ と ・

# Solution

### 1) Inside and Outside Functions

#### • The function C(R(p)) is a composition of two functions:

- The outside function is  $C(R) = 4R^2 + 20R + 50$ , where R = R(p).
- The inside function is  $R(p) = p \cdot q(p) = p(100 2p)$ .

• To differentiate, we will apply the Chain Rule:

$$\frac{d}{dp}C(R(p)) = \frac{d}{dR}C(R) \cdot \frac{d}{dp}R(p)$$

35/39

### 2) Differentiate the Outside Function

• Differentiate  $C(R) = 4R^2 + 20R + 50$  with respect to R:

$$\frac{d}{dR}C(R) = 8R + 20$$

• So, 
$$\frac{d}{dR}C(R(p)) = 8R(p) + 20.$$

• Substituting 
$$R(p) = p(100 - 2p)$$
:

$$\frac{d}{dR}C(R(p)) = 8\left(p(100 - 2p)\right) + 20 = 8p(100 - 2p) + 20$$

æ

36/39

・ロン ・回 と ・ ヨ と ・

# 3) Differentiate the Inside Function

- The inside function is R(p) = p(100 2p).
- Differentiate it with respect to p:

$$\frac{d}{dp}R(p) = \frac{d}{dp}\left(p(100 - 2p)\right) = 100 - 4p$$

3

### 4) Combine the Results

Now we combine the derivatives:

$$\frac{d}{dp}C(R(p)) = (8p(100 - 2p) + 20) \cdot (100 - 4p)$$

• This is the derivative of the composite cost function with respect to price p.

## Solution

$$\frac{d}{dp}C(R(p)) = (8p(100 - 2p) + 20) \cdot (100 - 4p)$$

This is the final expression for the derivative of the composite cost function C(R(p)).
